

Supplemental material

Supplemental Figures

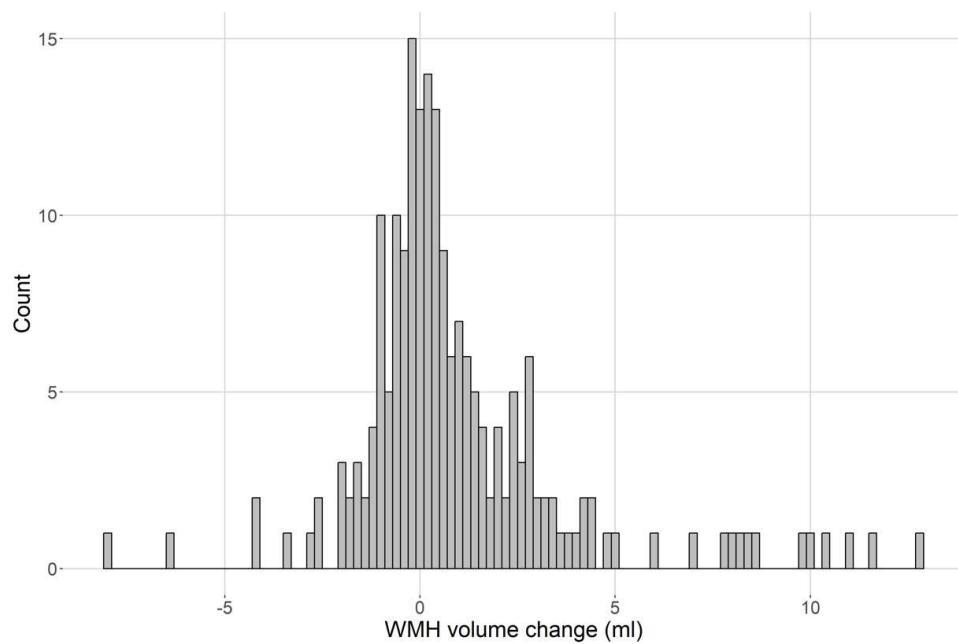

Figure S1. Distribution of WMH volume change (ml) over one year. WMH: white matter hyperintensity

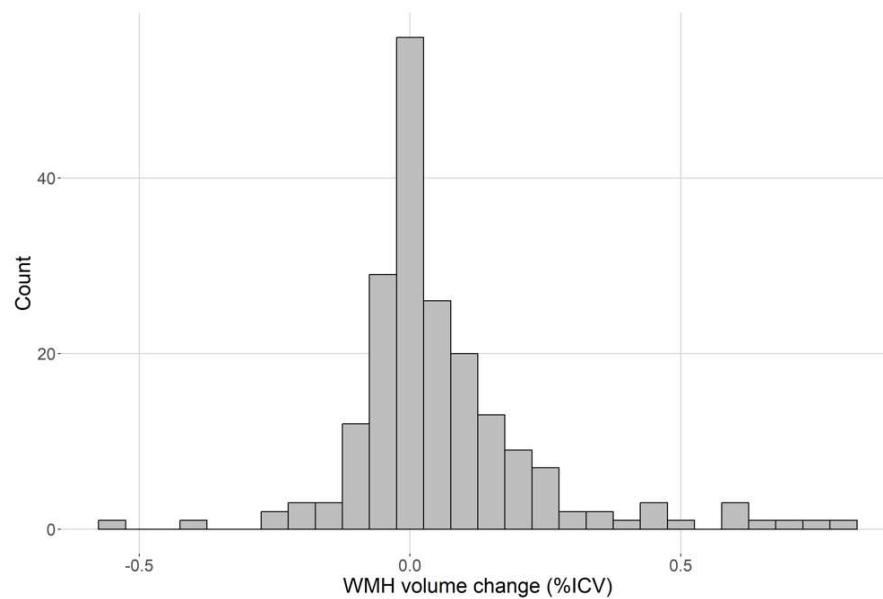

Figure S2. Distribution of WMH volume change (%ICV). ICV: Intracranial volume; WMH: White matter hyperintensity

Supplemental Results

Overview missing WMH volumes at one-year visit

N=230 participants were recruited into the study. After the one-year visit, WMH change volume were available for n=198. Reasons for missing scans (n=32) were:

- | | |
|--|-----|
| - Deceased | n=2 |
| - Illness and unable to participate in study | n=5 |
| - Declined MRI scan | n=8 |
| - Phone follow-up only (due to COVID-19) | n=6 |
| - Declined follow-up altogether | n=1 |
| - Not contactable despite multiple attempts | n=6 |
| - Poor imaging quality and not analysable | n=4 |

Overview of percentile approach

The WMH volume change was divided into percentiles and the percentile with least or no WMH volume change was identified. That percentile and the 10 percentiles below and above that percentile of 'no change' were combined and defined as the group with 'stable WMH' (Table S1). All percentiles above the +10 percentiles of no change were included in the progression group and all percentiles below -10 percentile of no change were included in the regression group. This resulted in a definition of stable WMH with a range of -0.15 to 0.15 ml (percentiles 25 – 45). WMH progression is defined as an increase of more than 0.15 ml (percentile 46-100) and WMH regression a decrease of more than 0.15 ml (percentile 0-24).

Supplemental Tables

Table S1. WMH volume change

Percentile	Change in ml			Change in %ICV		
	N	Mean	SD	N	Mean	SD
1	2	-7.15	1.18	2	-0.479	0.119

Darkest row marks percentile of no change. Rows in grey reflect the -/+ 10 percentiles included in the 'stable WMH' group.

Table S2. WMH volume change (%ICV) categorised using the percentile approach

	N	WMH regression	N	Stable WMH	N	WMH progression
Percentiles %ICV, mean (SD), [range]	56	-1.42 (1.43) [-7.98, -0.33]	42	0.01 (0.18) [-0.28, 0.33]	100	2.73 (2.85) [0.28, 12.84]

ICV: Intracranial volume; WMH: White matter hyperintensity

Table S3. WMH volume change (%ICV) categorised using the quintile approach

	Q1 (N=40)	Q2 (N=40)	Q3 (N=40)	Q4 (N=39)	Q5 (N=39)
Quintiles mean (SD), [range]	-1.79 (1.54) [-7.98, -0.68]	-0.27 (0.20) [-0.65, 0.03]	0.35 (0.18) [0.04, 0.70]	1.50 (0.64) [0.70, 2.49]	5.33 (3.11) [2.30, 12.84]

ICV: Intracranial volume; WMH: White matter hyperintensity
